

PreservDOX

Product Overview

Safeguarding Data When Networks Go Down

Schools. Hospitals. Law firms. Every organization has documents it can't afford to lose. That's why Kyocera created PreservDOX™. If events occur that force your network resources to go down, this powerful business application provides you with an additional layer of protection that goes beyond conventional backup routines.

Critical documents can be saved to a designated synched folder at your PC and automatically routed to your predefined Kyocera HyPAS®-enabled MFP for safe keeping and immediate access. To protect confidentiality of the routed files, PIN codes are assigned to each folder – eliminating unauthorized access to the data. In addition, PreservDOX™ can provide your administrators with status information on when the last update was sent, as well as cloning capability for them to disburse application settings across multiple devices.

PRESERVDOX IS A COMPLETE RECOVERY SOLUTION

Business continuity solutions do not address the period of time an organization is most vulnerable: the critical gap between a server going down and network operations being restored. Kyocera's PreservDOX™ offers flexibility that aligns with your business needs – allowing you to minimize downtime, maintain staff productivity and adhere to regulatory requirements.

PreservDOX™ is intended to supplement recovery protocols that your organization undertakes and can be part of a complete recovery strategy for your business. PreservDOX™ is limited to providing your organization access to PDF documents that have been saved within the application, prior to any interruption.

PreservDOX is a trademark of Kyocera.
